

First noted in 1947 as an 'ancient yew-tree, partly hollow' in the *History of the County of Warwick*.

2009: The female yew grows south of the church, its branches dipping to within a foot of the ground for most of its circumference. It is a hollow shell, with two gaps at the ground of 1' 5" and 6". A complete join of wood from 5' and above, from where several thick branches grow upwards, and where they face away from the church at right angles. All branches appear to be of similar age – suggesting that at some time the tree was cut back to a height of 5' 6". There has been much cutting of branches on the north side facing the church to prevent them from reaching the ground. The trunk leans slightly towards the church, so on the south side roots have become exposed at the base of the tree. Girth 12' 5" at 3'.
